

Radial immunodiffusion **IMMULAB**

Measurement system for serum control

Immulab is dedicated to the control of serum dosage using the radial immunodiffusion technique.

During diffusion, the serum to be dosed reacts with the antiserum to form a circular precipitate.

Immulab automatically measures the two diameters of this precipitate.

Applications, Systems

The Immulab software

The Immulab software, which is perfectly integrated into the Windows environment, provides automatic and semi-automatic measurements of the diameters of each well after complete acquisition of the film with a scanner.
